# PCOS and the DUTCH Test

Connecting PCOS and the Development of Autoimmunity

Mark Newman, President/Founder of Precision Analytical  
Dr. Kelly Ruef, DUTCH Clinical Educator

# High prevalence of Hashimoto's thyroiditis in patients with polycystic ovary syndrome: does the imbalance between estradiol and progesterone play a role?

Ayşe Arduc<sup>1</sup>, Bercem Aycicek Dogan<sup>2</sup>, Sevgi Bilmez<sup>3</sup>, Narin İmga Nasiroğlu<sup>2</sup>,

## Abstract

**Objective:** Some similar factors, such as genetic susceptibility and subinflammation/autoimmunity, contribute to development of both polycystic ovary syndrome (PCOS) and Hashimoto's thyroiditis (HT), suggesting a potential pathogenic link between the two common disorders. In this study, we investigated the relationship between PCOS and HT, considering the possible effect of PCOS-related hormonal and metabolic factors on thyroid autoimmunity.

**Methods:** Eighty-six reproductive-age women diagnosed with PCOS according to Rotterdam criteria and 60 age-BMI matched control women were included in the study. All subjects had thyroid function tests, thyroid peroxidase anti-body (anti-TPO), thyroglobulin anti-body (anti-Tg), LH, FSH, estradiol, progesterone, androgens, fasting glucose, insulin, lipid, homeostasis model assessment insulin resistance (HOMA-IR) levels, thyroid and pelvic ultrasounds.

**Results:** TSH, anti-TPO ( $p = 0.017$ ), anti-Tg ( $p = 0.014$ ), LH, DHEAS, testosterone, and HOMA-IR levels were significantly higher and progesterone were lower in PCOS women than in controls. Free T4, free T3, FSH, estradiol levels and thyroid volume were similar between the two groups. A higher percentage of PCOS patients had elevated TSH (26.7 and 5%;  $p = 0.001$ ), anti-TPO (26.7 and 6.6%;  $p = 0.002$ ), and anti-Tg (16.2 and 5%;  $p = 0.039$ ). HT was more common in PCOS patients compared to controls (22.1 and 5%;  $p = 0.004$ ). Estradiol ( $p = 0.003$ ) were higher in anti-TPO positive PCOS women than anti-TPO negative ones. Anti-TPO was correlated positively with estradiol, estradiol/progesterone ratio, and TSH.

Table 1. Characteristics of PCOS patients and controls.

Variables	PCOS ( <i>n</i> = 86)	Control ( <i>n</i> = 60)	<i>p</i> Value
Age, year	24.6 ± 5.7	26.17 ± 5.0	0.621
BMI, kg/m <sup>2</sup>	24.9 ± 3.6	23.4 ± 2.9	0.173

## Basic Facts About PCOS & HT in women

- PCOS is the most common endocrine disorder
- HT is the most common AI disease (~10x more in women)
- Hypothyroidism may lower SHBG, worsening PCOS
- HT is more common (~4x) in women with PCOS

# Evolving our understanding of the most meaningful measurements

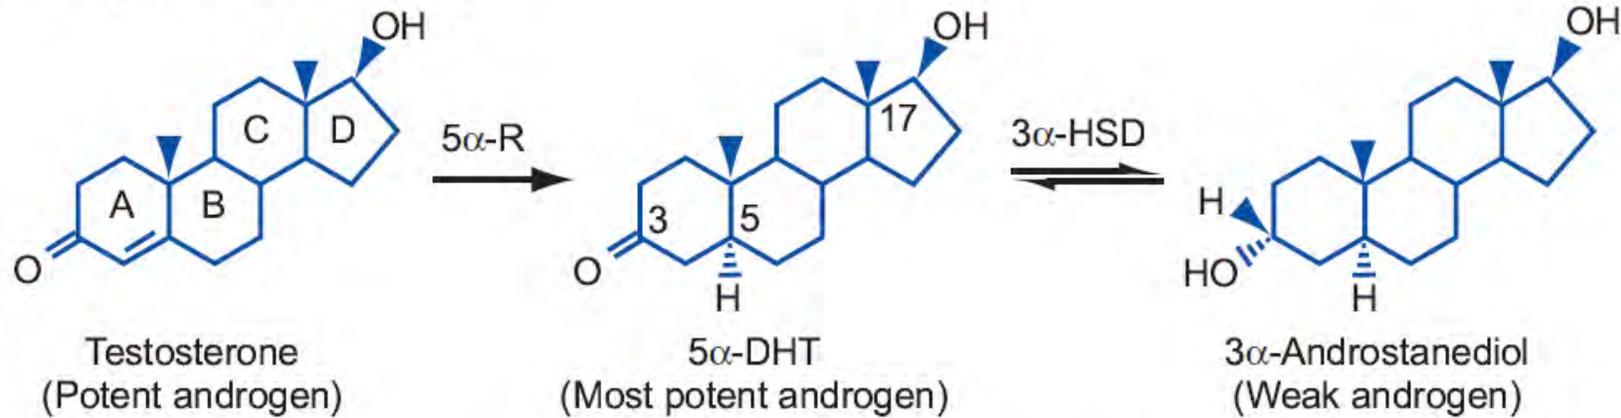

80 Y. Jin and T. M. Penning

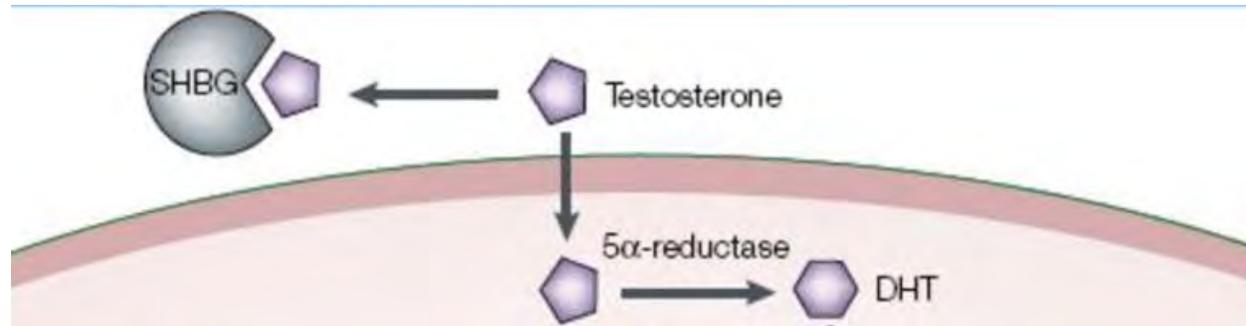

**Figure 1.** Conversion of androgens of different potencies mediated by 5 $\alpha$ -R and 3 $\alpha$ -HSD.

Secreted primarily by the testis in men, testosterone is the principal circulating androgen with a high affinity of  $10^{-10}$  M for AR. In androgen target cells, testosterone is converted to 5 $\alpha$ -dihydrotestosterone (5 $\alpha$ -DHT), which is the most potent natural androgen known, with an affinity of  $10^{-11}$  M for AR.<sup>4,5</sup>

5 $\alpha$ -DHT is subsequently inactivated to the weak androgen 3 $\alpha$ -androstanediol ( $K_d$  of  $10^{-6}$  M for AR) by the action of 3 $\alpha$ -hydroxysteroid dehydrogenase.

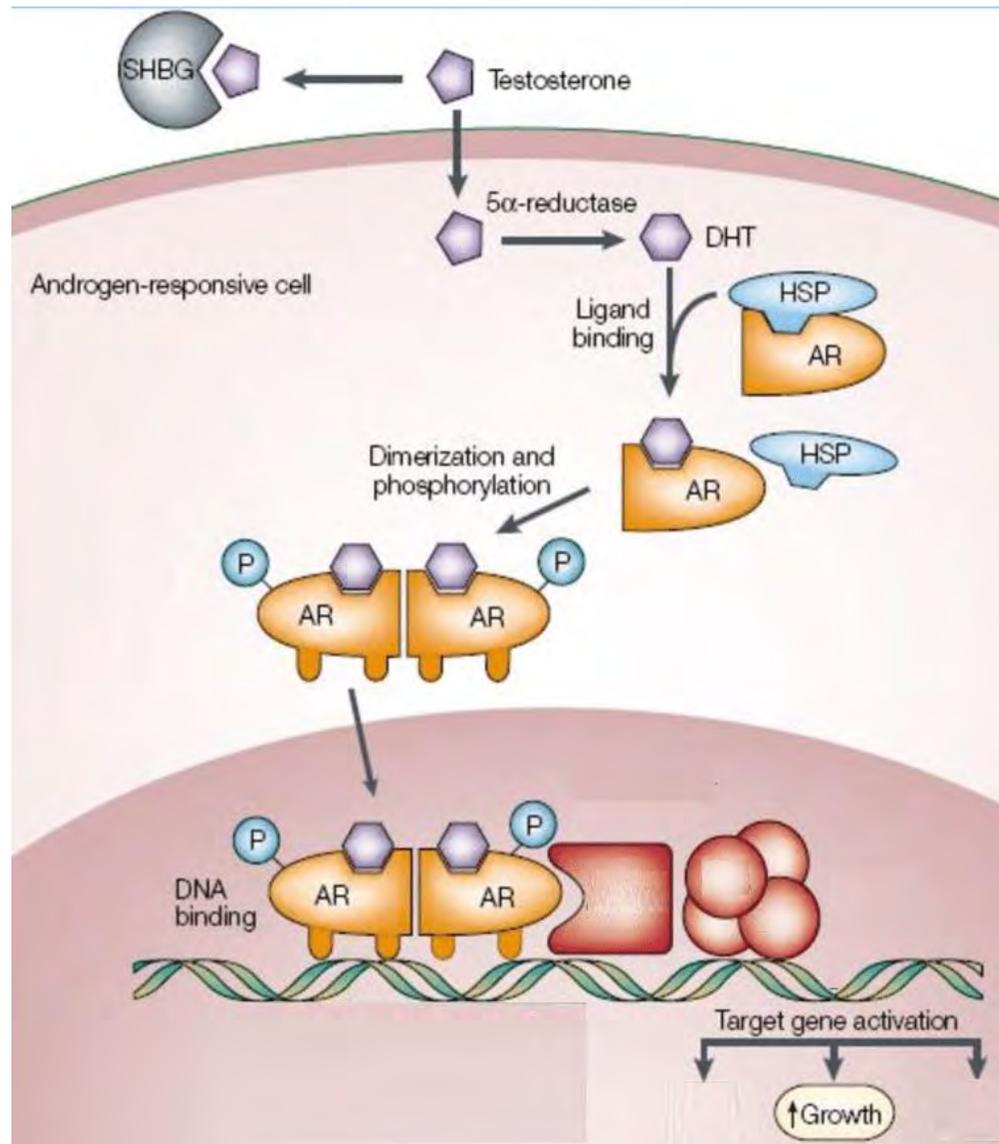

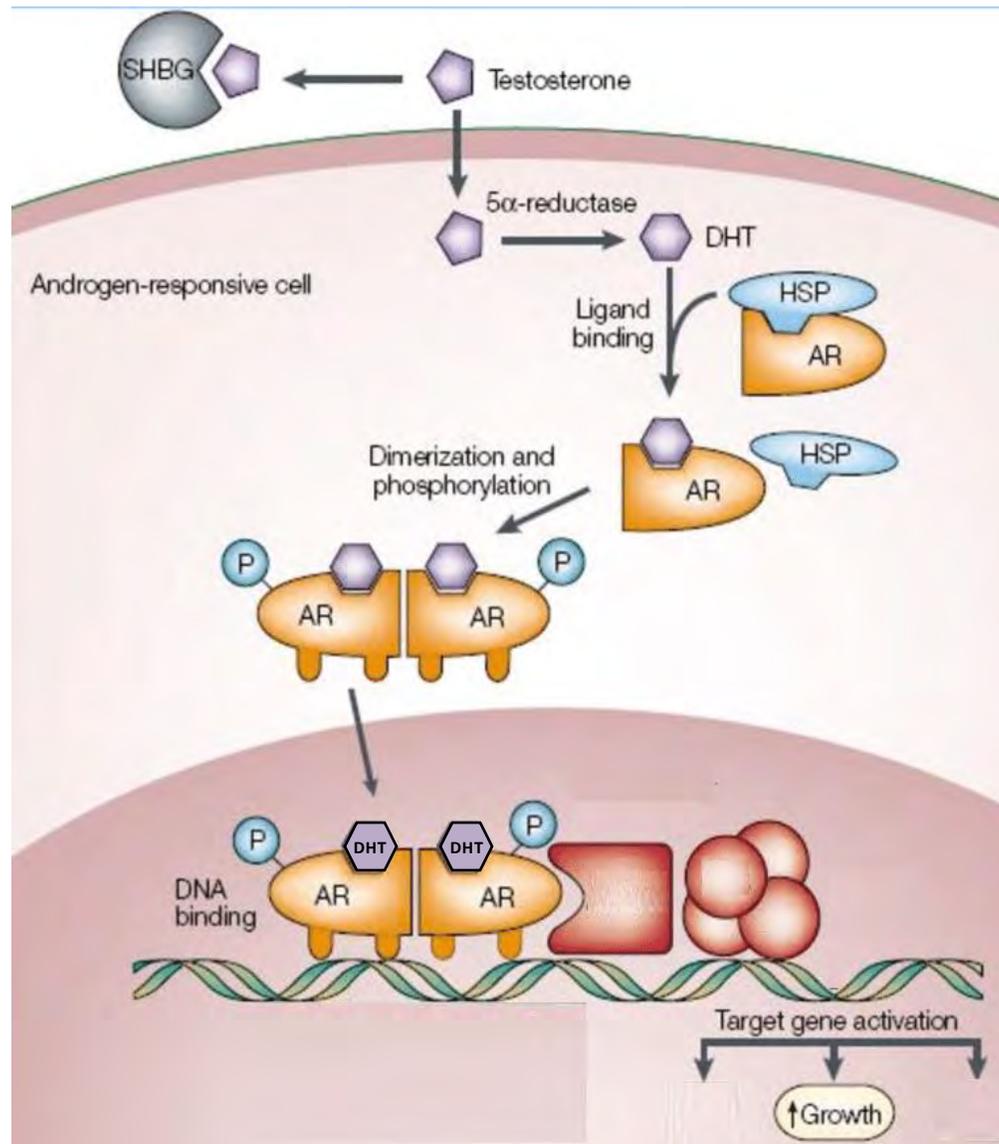

The most meaningful Testosterone is free

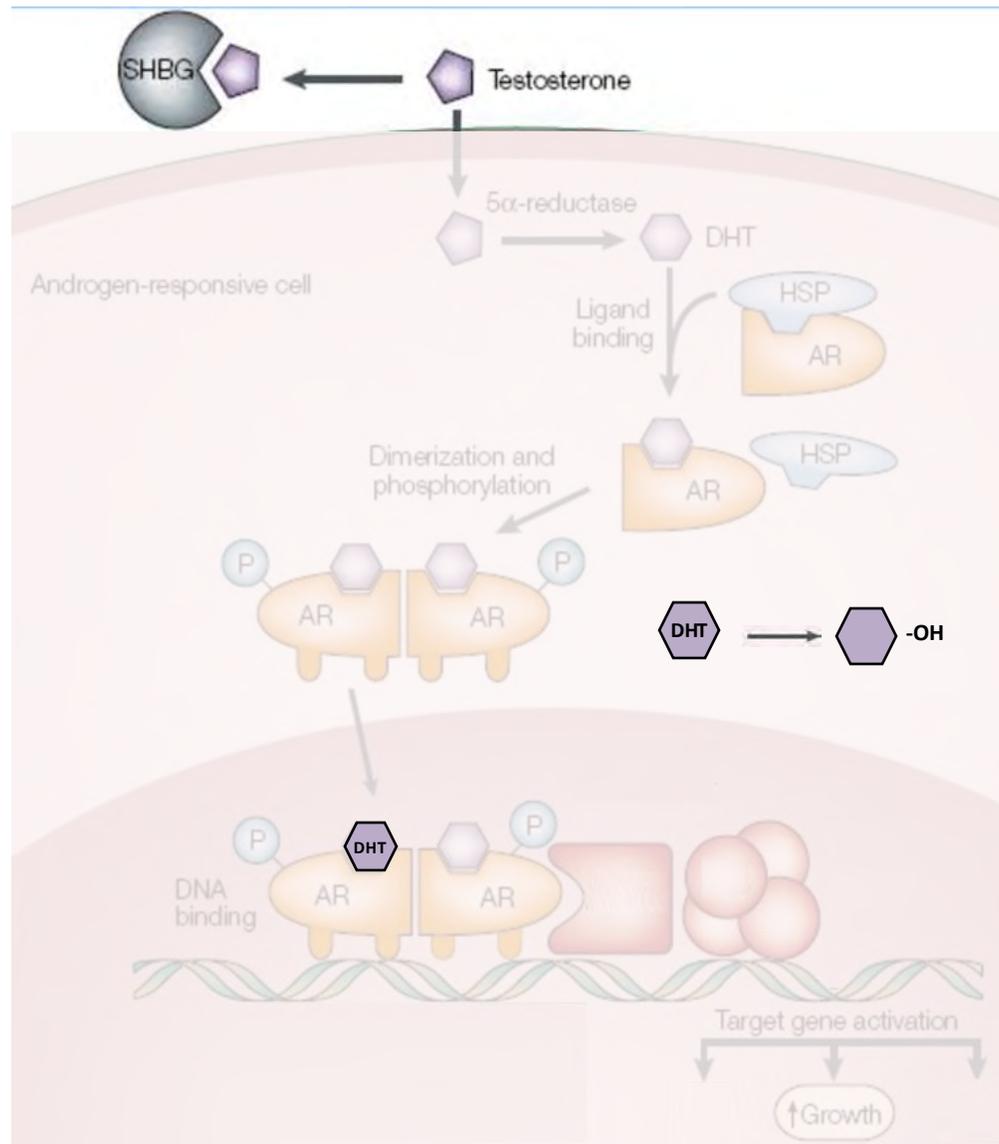

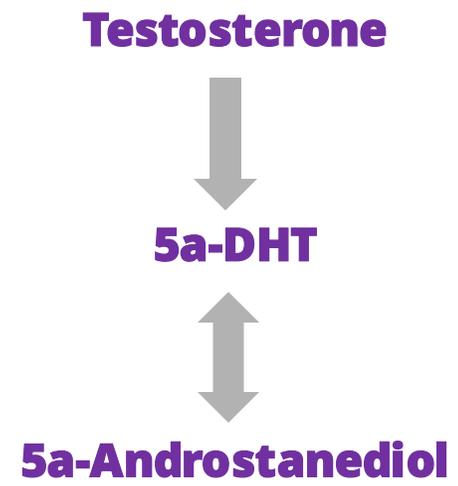

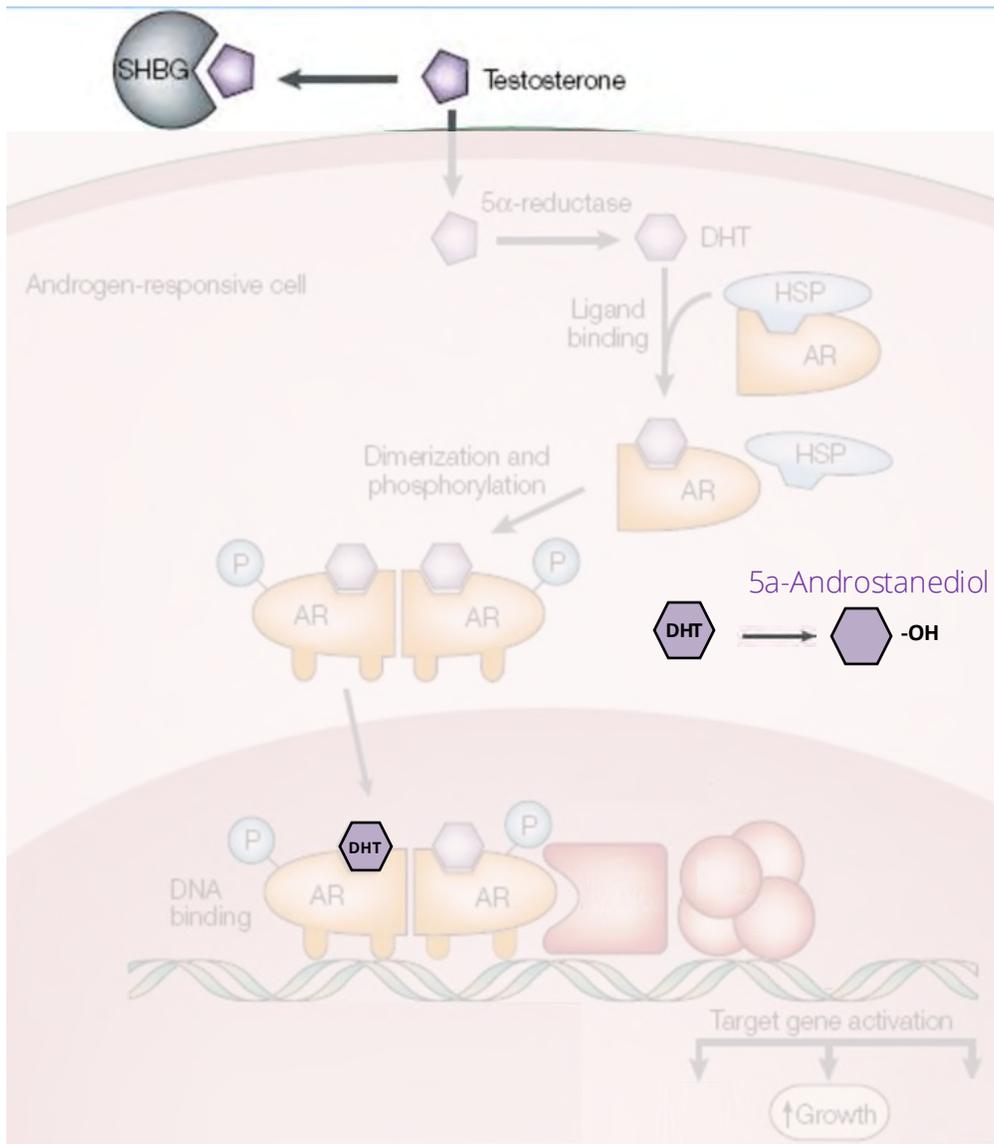

The most meaningful Testosterone is free

The most meaningful DHT is intracellular

PMID: 19931651 DOI: [10.1016/j.autrev.2009.11.014](https://doi.org/10.1016/j.autrev.2009.11.014)

## Abstract

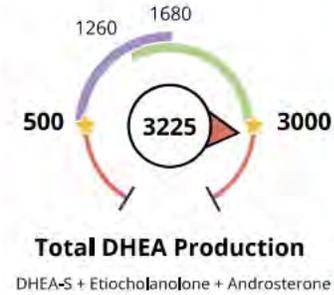

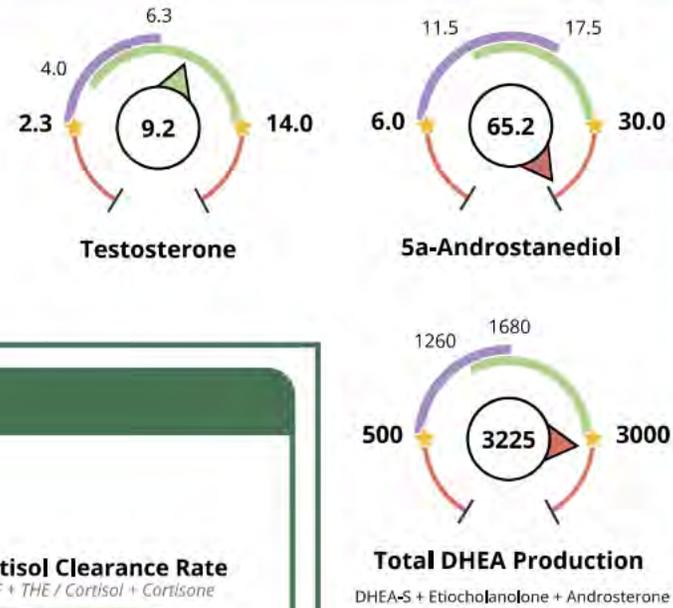

The etiology of autoimmune disease is multifactorial, including genetic, environmental, hormonal, and immunological factors. Nevertheless, the onset of autoimmune disorders remains enigmatic. Physical and psychological stresses have been suggested in the development of autoimmune disease, since numerous animal and human studies demonstrated the effect of stressors on immune function. Moreover, many retrospective studies had found that a high proportion (up to 80%) of patients reported uncommon emotional stress before disease onset. This, however, is not surprising as the disease itself causes significant stress in the patient. Recent reviews discuss the possible role of psychological stress, and of the major stress-related hormones, in the pathogenesis of autoimmune disease and presume that the stress-triggered neuroendocrine hormones lead to immune dysregulation, which ultimately results in autoimmune disease by altering or amplifying cytokine production. However, there is no evidence based research to support this concept. Nonetheless, stress reactions should be discussed with autoimmune patients. Applied implications are discussed, concentrating on the need for multidisciplinary care interventions that target patients' disease symptoms and help them cope with their illness.

## Hormone Testing Summary

### ESTROGEN & PROGESTERONE

- **High estrogen impacts the immune system, making patients susceptible to AI**
- **Pg adequacy helps blunt high E2 effects**
- **E2 and Pg, and their ratio, are relevant**
- **“High” E2 can be “dominant” to Pg without actually being elevated**

■ Optimal Luteal Range ■ Postmenopausal Range ■ Out of Range ★ Edge of Range

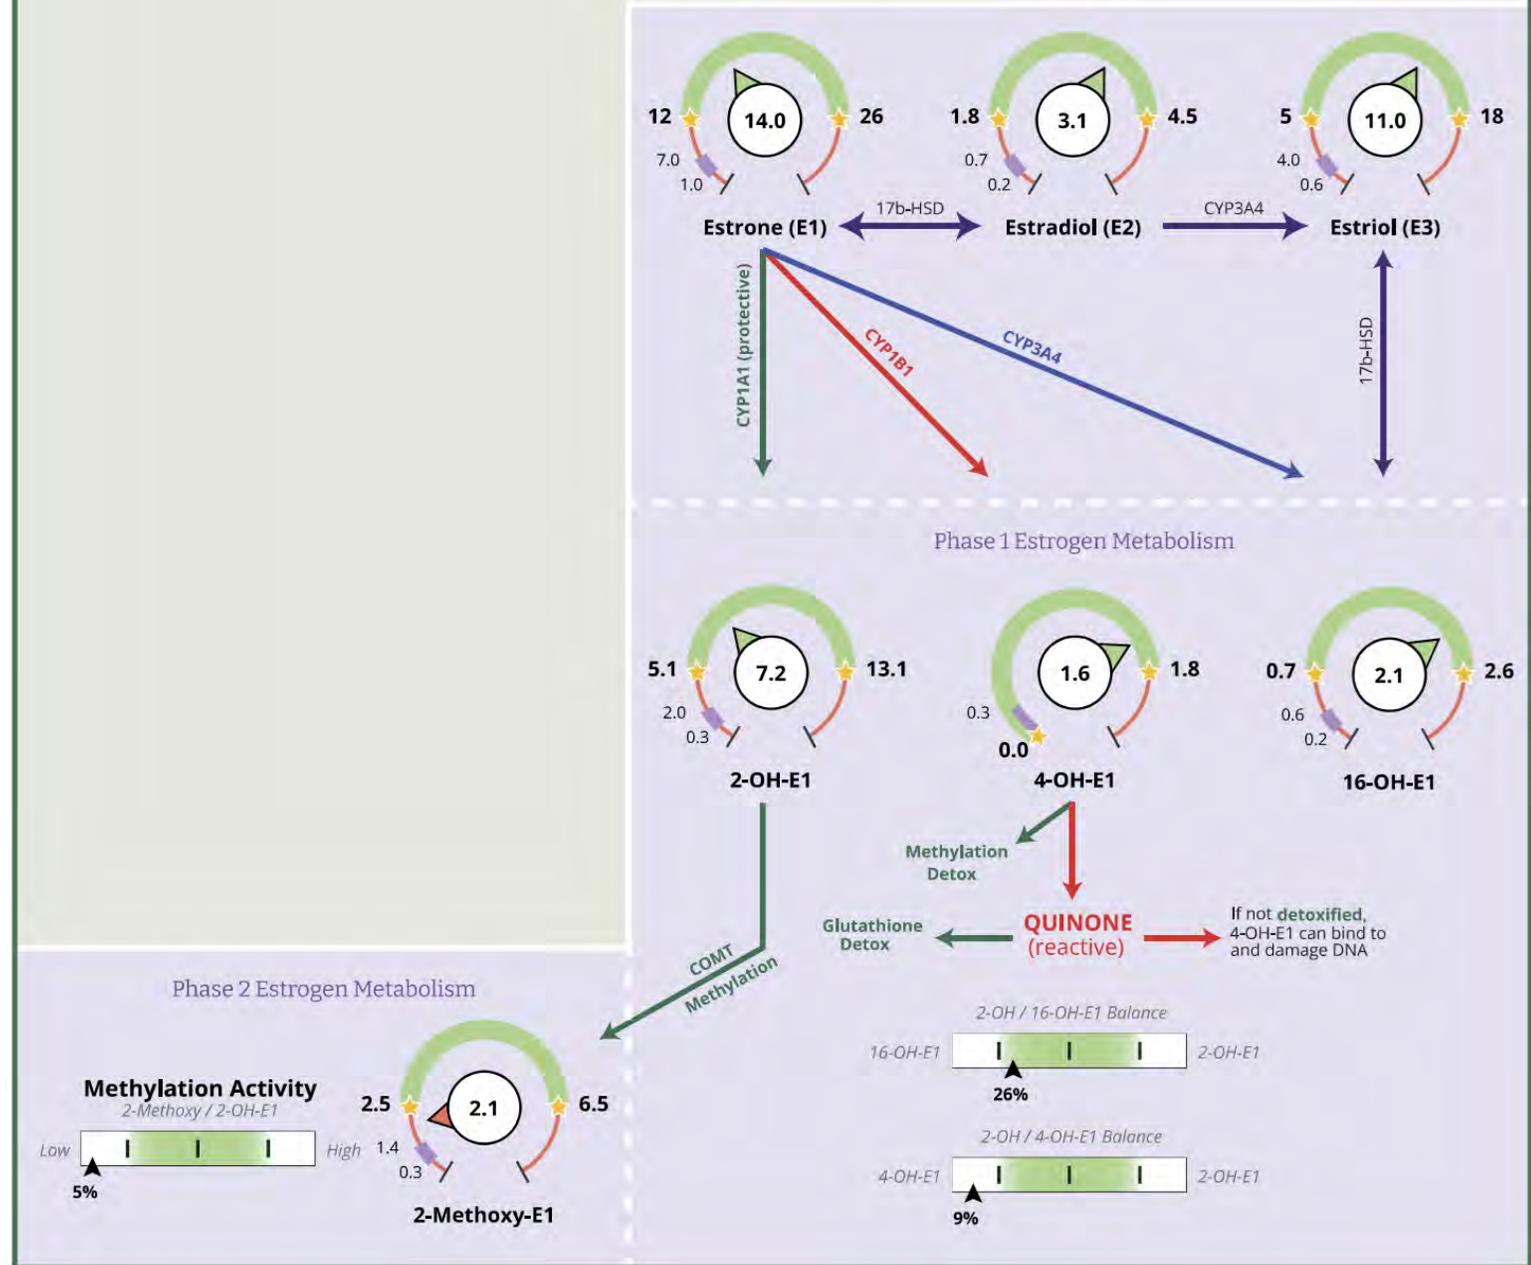

\*Progesterone Serum Equivalent is a calculated value based on urine pregnanediol.

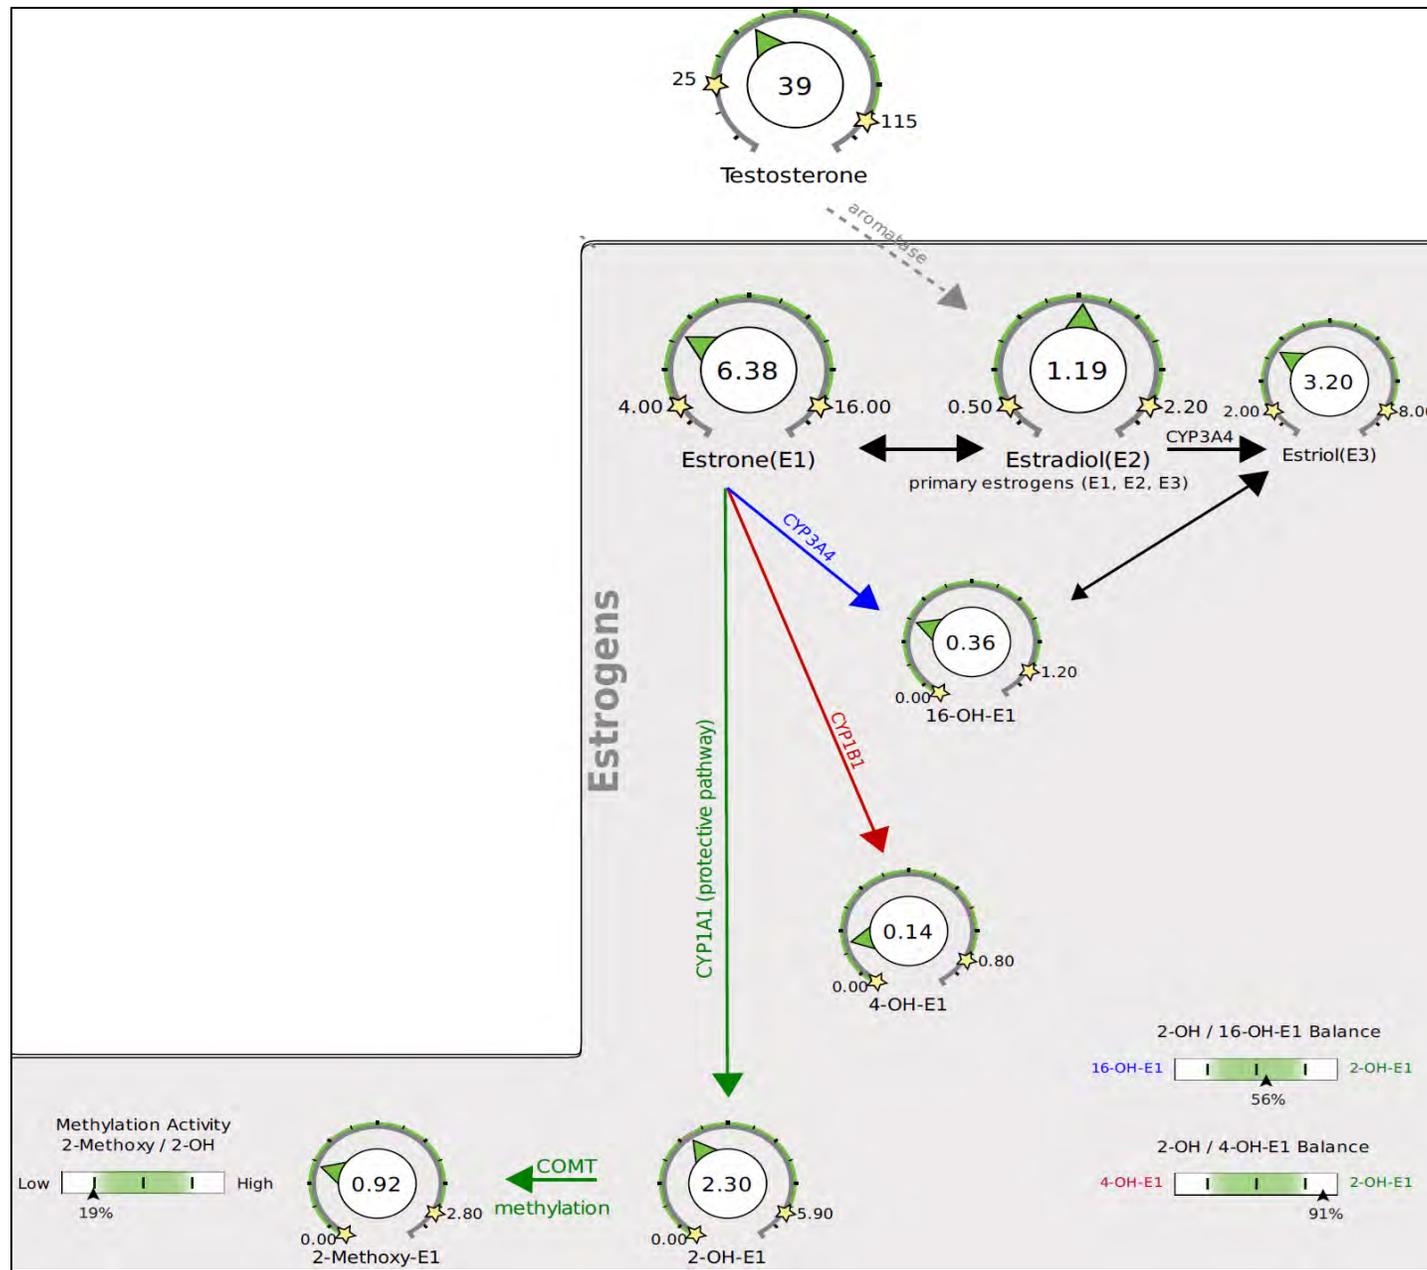

\*\*Free cortisol best reflects tissue levels. Metabolized cortisol best reflects total cortisol production.

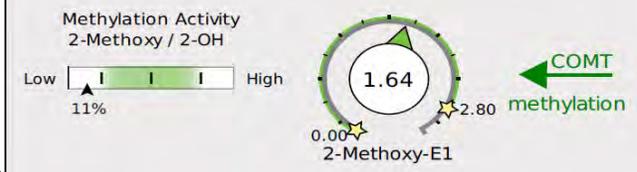

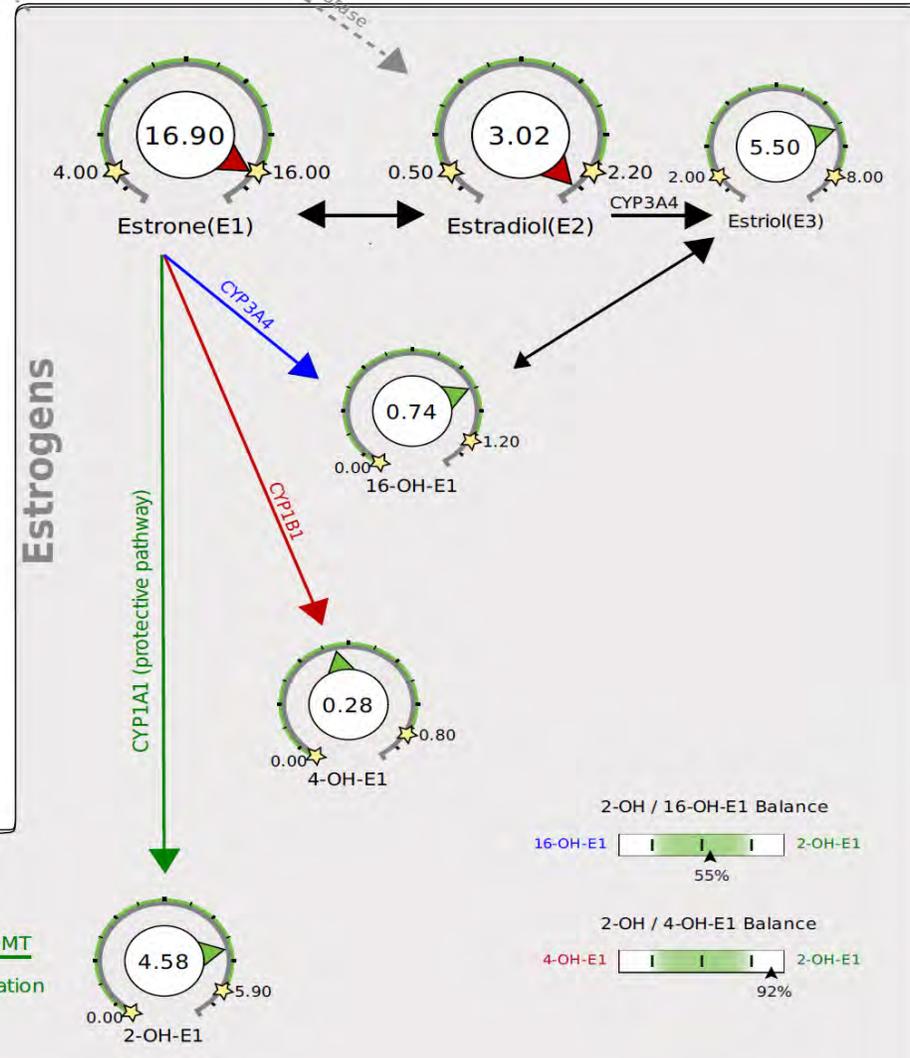

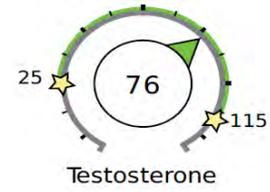

# PCOS & AI Link?

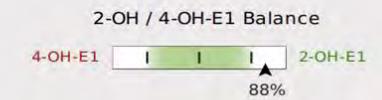

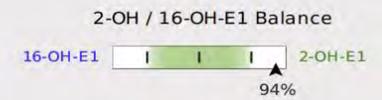

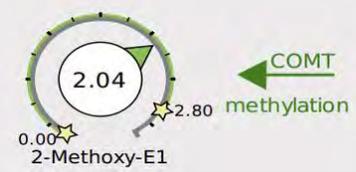

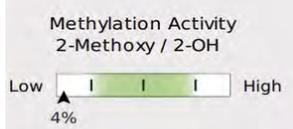

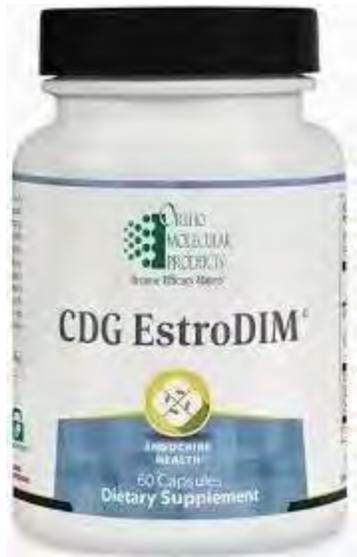

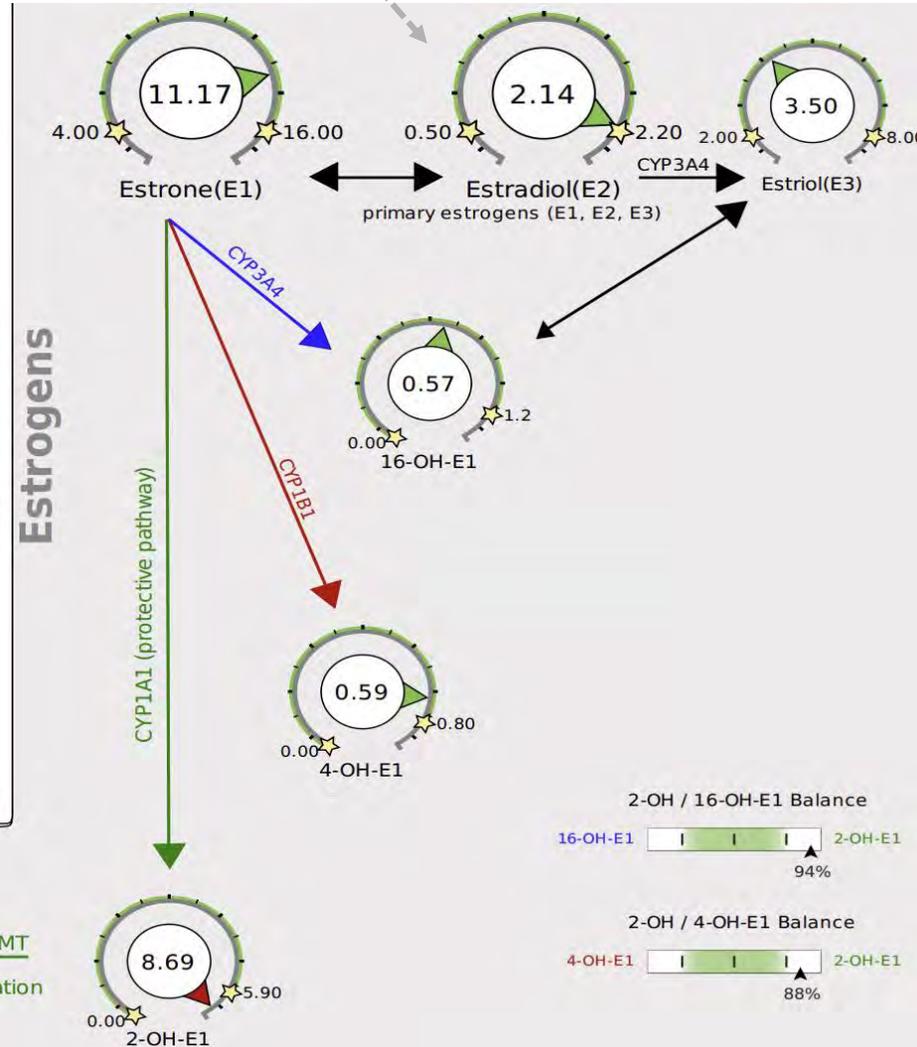

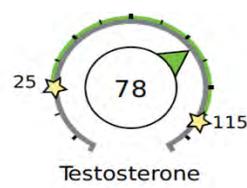

1. Estrogen Status
2. Phase 1 Metabolism
3. Methylation (Phase 2)

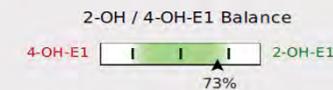

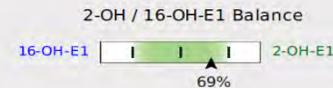

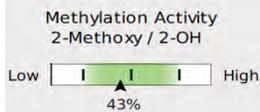

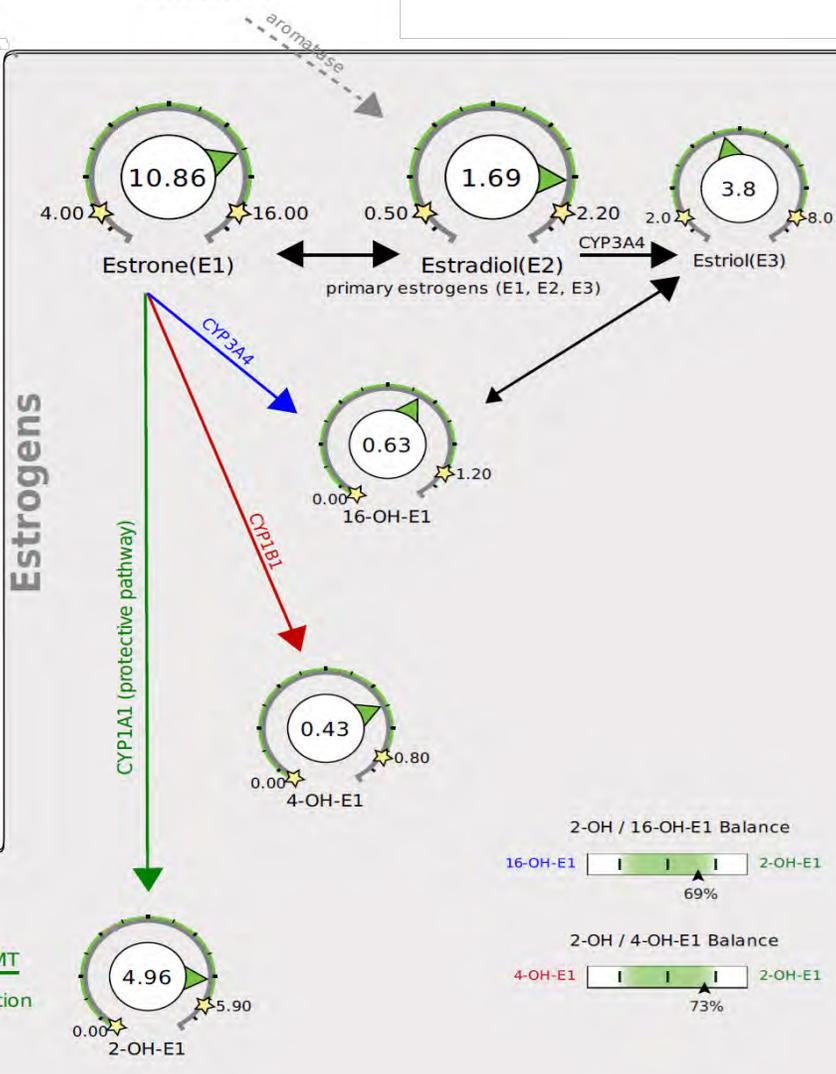

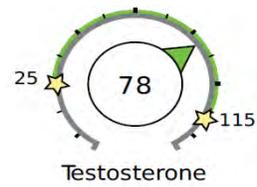

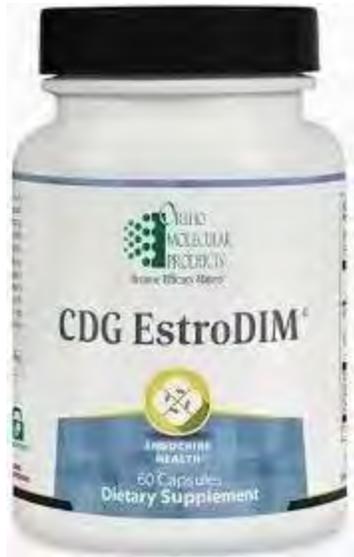

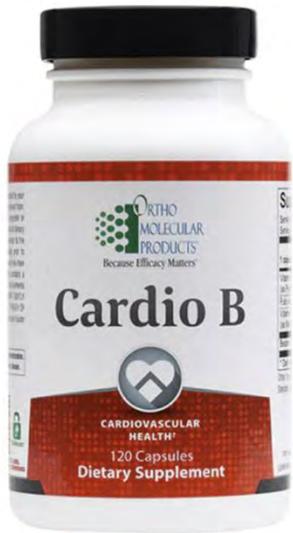

Poor phase 1 or methylation can increase E1, E2 and 16OHE1

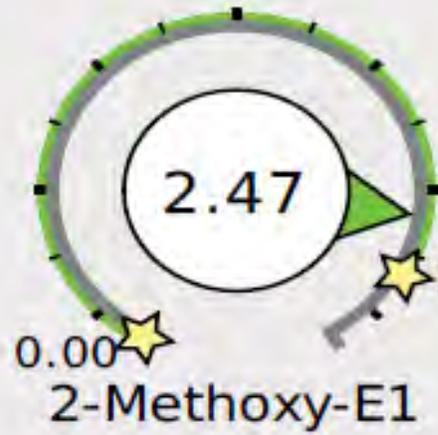

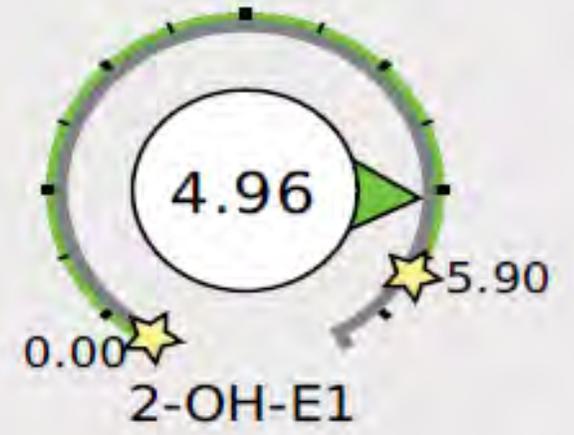

# Methylation Activity 2-Methoxy / 2-OH

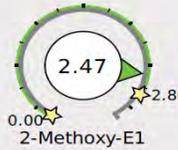

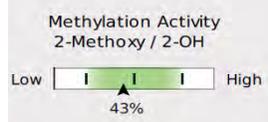

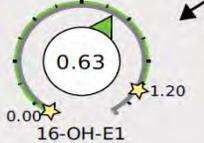

← COMT  
methylation

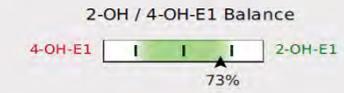

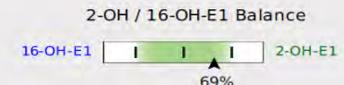

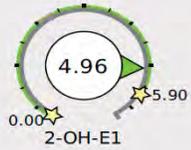

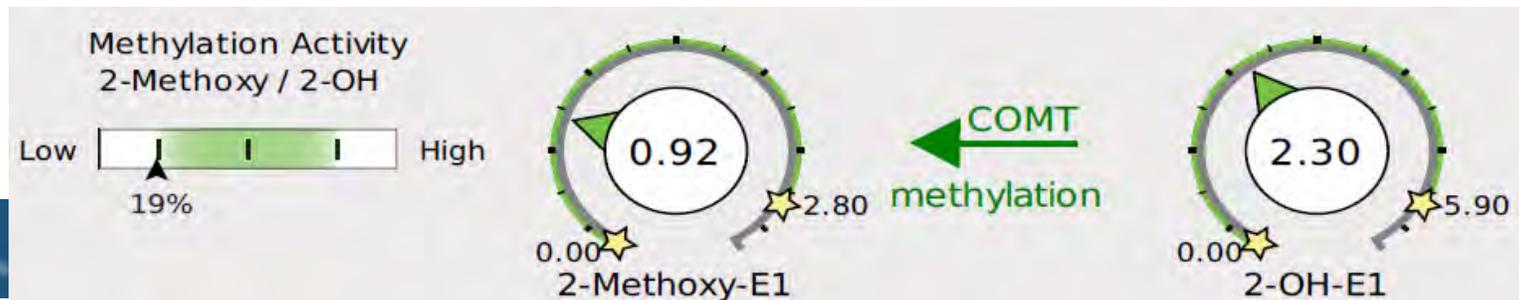

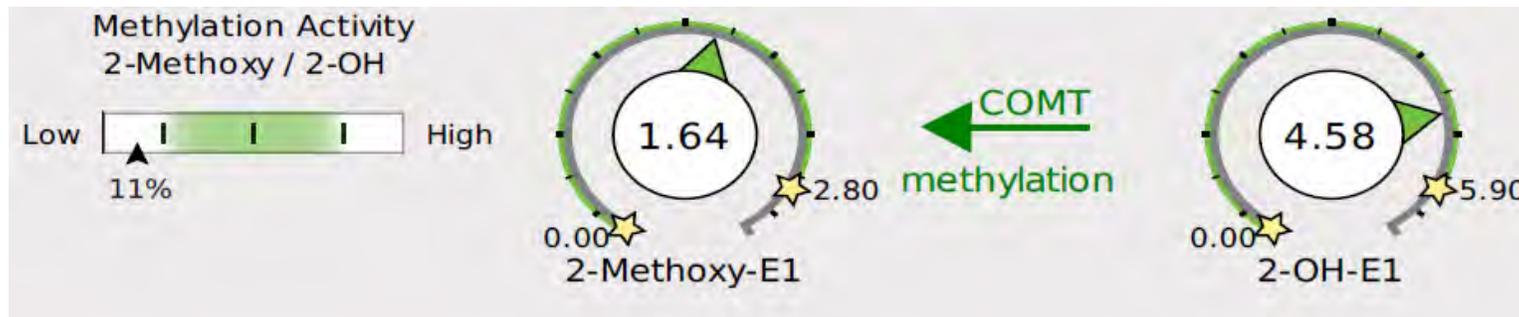

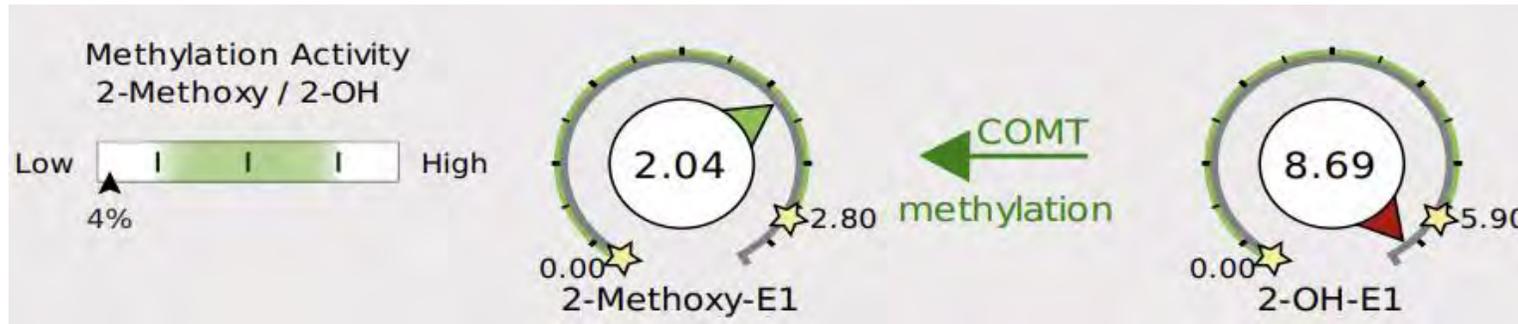

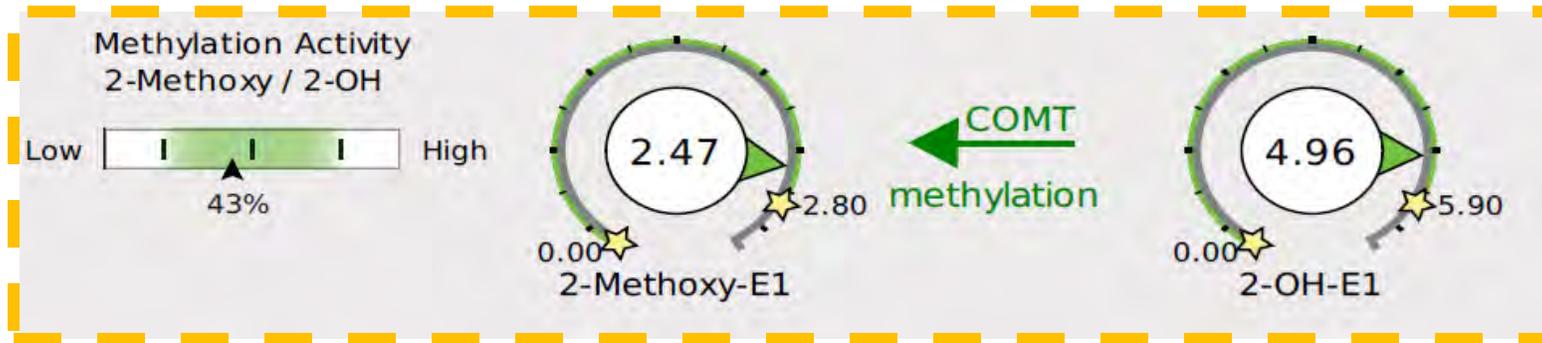

Estrogens

CYP1A1 (protective pathway)

← COMT  
methylation

## Why do Estrogen Metabolites Matter?

- “Sluggish” metabolism increases E1/E2
- Higher 16OH-E1 increases estrogenic action

## Why do OATs Matter in PCOS?

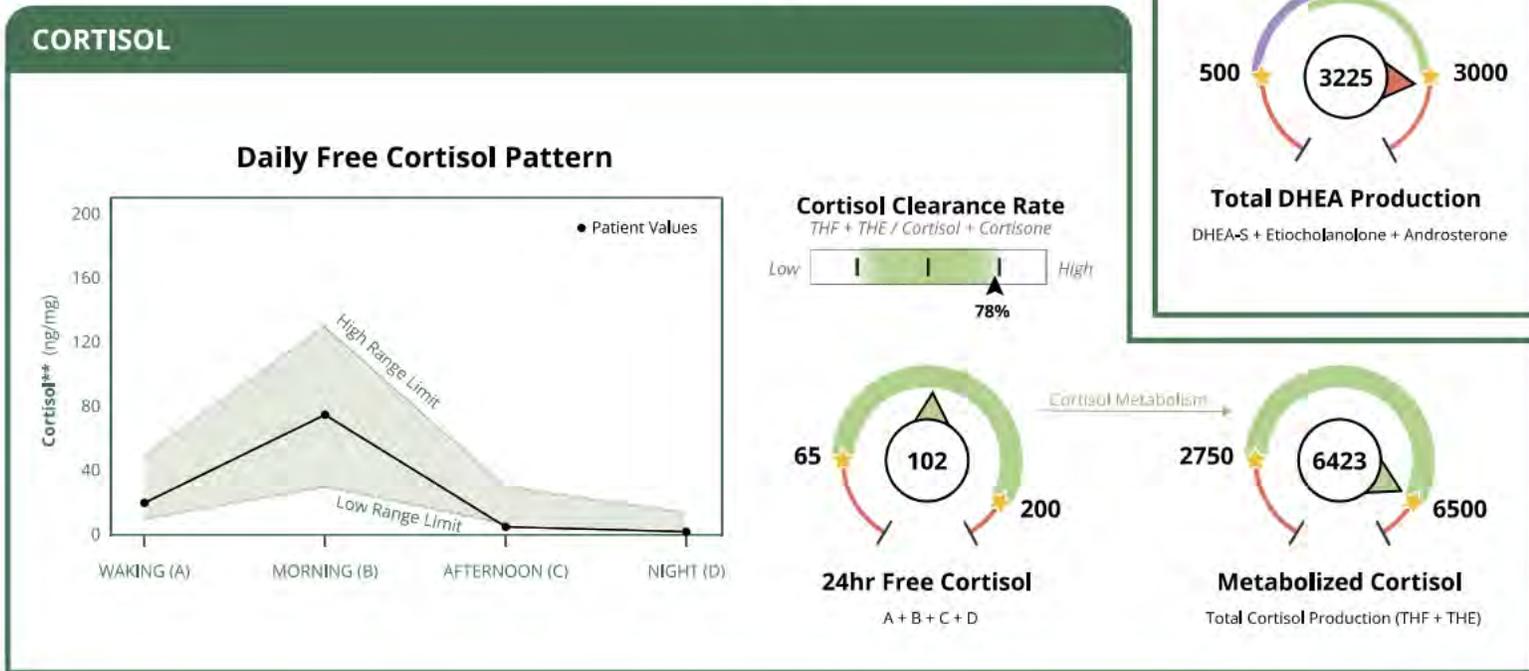

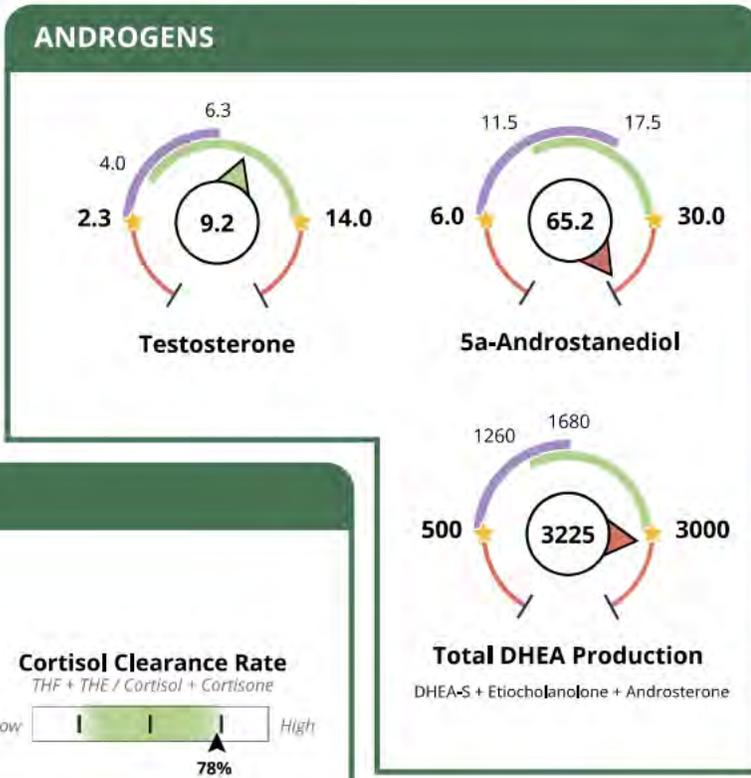

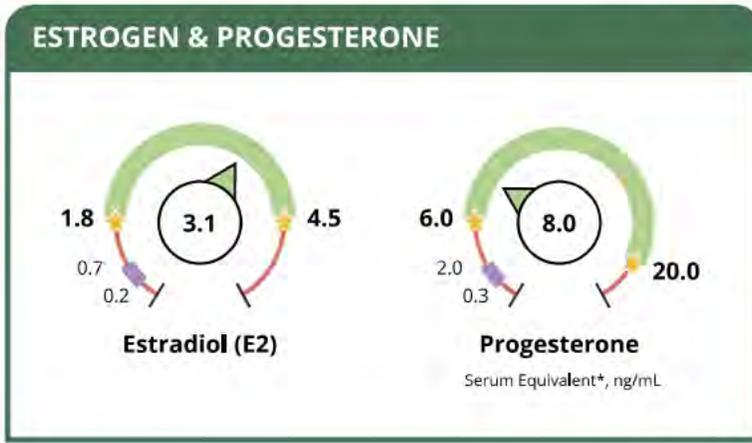

- Indirect impact on estrogen and metabolism
  - Indirect and direct impact on/from PCOS

## Organic Acid Tests (OATs)

TEST	RESULT	UNITS	NORMAL RANGE	
<b>Nutritional Organic Acids (Urine)</b>				
Vitamin B12 Marker - May be deficient if high				
Methylmalonate (MMA)	Above range	4.9	ug/mg	0 - 2.5
Vitamin B6 Markers - May be deficient if high				
Xanthurenate	Above range	1.23	ug/mg	0.12 - 1.2
Kynurenate	Above range	5.3	ug/mg	0.8 - 4.5
Biotin Marker - May be deficient if high				
b-Hydroxyisovalerate	Within range	7.9	ug/mg	0 - 12.5
Glutathione Marker - May be deficient if low or high				
Pyroglutamate	Above range	90.0	ug/mg	28 - 58
Gut Marker - Potential gut putrefaction or dysbiosis if high				
Indican	High end of range	90.4	ug/mg	0 - 100
<b>Neuro-Related Markers (Urine)</b>				
Dopamine Metabolite				
Homovanillate (HVA)	Within range	4.4	ug/mg	3 - 11
Norepinephrine/Epinephrine Metabolite				
Vanilmandelate (VMA)	Above range	7.3	ug/mg	2.2 - 5.5
Neuroinflammation Marker				
Quinolinate	Above range	13.2	ug/mg	0 - 9.6
<b>Additional Markers (Urine)</b>				
Melatonin - Waking				
6-OH-Melatonin-Sulfate	Below range	1.3	ng/mg	10 - 85
Oxidative Stress / DNA Damage - Waking				
8-Hydroxy-2-deoxyguanosine (8-OHdG)	Within range	3.8	ng/mg	0 - 5.2
